Architecture for Complex Enterprise Systems.

SVLS LABS is a vendor-neutral enterprise architecture and software engineering company. We help organisations modernise ERP, integration, cloud and AI landscapes through future-state architecture, governed engineering and purpose-built enterprise software. Founded 2020.

2020
founded. SVLS LABS LLP

25+
years of ERP delivery experience across our key architects

1
written contract per interface, before code

2 wks
focused architecture assessment, fixed scope and price

Six Practices. One Architecture Standard.

01 · ENTERPRISE ARCHITECTURE

Future state you can execute

Future-state architecture, technology roadmaps, application portfolio rationalisation, platform architecture, governance and technical due diligence.

02 · ERP MODERNISATION

Modernise the core, keep control

Modernisation strategy, legacy and custom-code modernisation, extension rationalisation, upgrade-risk assessment and cloud transition. Clean core by default.

03 · INTEGRATION AND CLOUD

Integration you can trust

API and event-driven architecture, hybrid and legacy integration, cross-system orchestration, integration governance and cloud architecture.

04 · AI AND AGENTIC ARCHITECTURE

Agents through governed interfaces

Enterprise agent architecture, tool and API governance, human-in-the-loop design, deterministic validation, execution governance and audit.

05 · SOFTWARE ENGINEERING

Where standard platforms stop

Purpose-built applications, workflow and integration products, decision-support software, internal platforms, modern APIs and cloud-native services.

06 · ARCHITECTURE ASSESSMENT

The fixed-scope way to start

Current-state architecture, risk register, future-state architecture, modernisation roadmap, priority initiatives and an implementation plan.

We work above individual platforms: ERP, CRM, cloud and data platforms, legacy applications, middleware, custom software, AI agents, APIs and event platforms.

Discover. Architect. Engineer. Govern. Evolve.

01 Discover
Map systems, workflows, interfaces, dependencies and constraints.

02 Architect
Define the future-state architecture and the transition path.

03 Engineer
Build integrations, services, applications and controls.

04 Govern
Put security, validation, evidence and operational controls in place.

05 Evolve
Keep the landscape coherent as business and technology change.

Enterprise AI Should Not Bypass Architecture

GOVERNED INTERFACES

Agents reach systems through defined tools and APIs with scopes and limits.

DETERMINISTIC NUMBERS

Business calculations in versioned, tested code. The model explains; it does not compute.

VALIDATE, APPROVE, VERIFY

Checks before execution, approval by risk, independent read-back afterwards, evidence per action.

Products from Recurring Problems

Value Lens (private beta). Decision support and financial controls over ERP data. Read-only tools, deterministic computation under versioned policies, and evidence-backed cases a reviewer accepts or dismisses. First use case: margin leakage in order-to-cash.

> Private beta on synthetic ERP-like data. Production ERP connector in development.

How to Start

Start with an Architecture Assessment, or book a discovery call with an architect. NDA before discovery. Replies within one business day.
